Explanation

Claims 1, 3-5, 7, 9-11, 13 and 15-17 do not involve an inventive step in the light of documents 1-7.

Documents 1-4 all disclose a lithium secondary battery that uses a mixture of spherical graphite and flat graphite as a negative electrode and suggest that the range of particle size overlaps with the range set forth in the present application. Although there is no specific disclosure relating to the concomitant use of a water-based resin and a rubber-based resin as the binder, the use of a water-based resin and a rubber-based resin as the binder in the negative electrode of lithium secondary battery is well-known, as suggested in documents 5-7.

Moreover, although there are no specific disclosures relating to the size of the crystallite along the c-axis, the tap density, parameters using the Raman spectral, and secondary particle size when particles become secondary particles, both the present invention and the inventions disclosed in documents 1-4 aim to achieve the effect of using several types of graphite of differing shape and

size concomitantly. Furthermore, if we examine the entire description of the present application, there is no disclosure suggesting an unexpected effect due to the size of the crystallite along the c-axis, the tap density, parameters using the Raman spectral, and secondary particle size when particles become secondary particles and, therefore, it appears that if measured, the carbon material disclosed in documents 1-4 would fulfil these conditions or that these conditions could be suitably derived as matters of design.

Claims 2, 8 and 14 do not involve an inventive step in the light of documents 1-8. The feature of coating the surface of the graphite material with a non-graphite carbon coating is known, as disclosed in document 7.

Supplemental Box

In case the space in any of the preceding boxes is not sufficient.

Continuation of:

III.

Of the claims amended by the amendment submitted with the correspondence dated 18 November 2004, claims 6 and 18 introduce new subject matter relating to the coating density of the negative electrode and claim 19 introduces new subject matter relating to the inclusion of vinylene carbonate in the non-aqueous electrolyte. No international search was carried out with respect to either of these technical features in the international search report.
